*The talk is based on the joint work with Mieczysław Mastyło*

*Session: 4. Banach Spaces and Operator Theory with Applications*

During this talk we present upper bounds of the Hilbertian norm of projections on finite-dimensional subspaces of interpolation spaces generated by certain abstract interpolation functors and show applications to Calderón-Lozanovskii spaces. We prove estimates of the $p$-factorization norm and projection constants for finite-dimensional Banach lattices. We specialize our results to a class of $n$-dimensional symmetric Banach spaces $E_n$ and are able to show that the projection constant $\lambda(E_n)$ satisfy $\lim_{n\to\infty} \lambda(E_n)/\sqrt{n} = c$, where $c = \sqrt{2/\pi}$ in the real case and $c = \sqrt{\pi}/2$ in the complex case.
