Session: 33. Spaces of analytic functions

In this talk I will discuss new function-theoretic estimates for the essential norm of arbitrary weighted composition operators $uC_\varphi \colon f \mapsto u(f \circ \varphi)$ acting on the space BMOA and the Bloch space, where φ is an analytic self-map of the open unit disc $\mathbb{D}$ and $u \colon \mathbb{D} \to \mathbb{C}$ is an analytic function.
